TORQUE SPECIFICATIONS - DECIMAL HARDWARE

Use the torques in this chart when special torques are not given. These torques apply to fasteners with both UNC and UNF threads as received from suppliers dry, or when lubricated with engine oil. Not applicable if special graphities, Molydisulfide greases, or other extreme pressure lubricants are used.

1-1/2 inch	3160 to 3560	4285 to 4827

NOTE: Use thick nuts with Grade 8 bolts.

TORQUE SPECIFICATIONS - METRIC HARDWARE

Use the following torques when specifications are not given.

These values apply to fasteners with coarse threads as received from supplier, plated or unplated, or when lubricated with engine oil. These values do not apply if graphite or Molydisulfide grease or oil is used.

ENGINE OIL RECOMMENDATIONS

Case AKCELA No.1 Engine Oil is recommended for use in your Case Engine. Case AKCELA No.1 Engine Oil will lubricate your engine correctly under all operating conditions. If Case AKCELA No. 1 Multi-Viscosity Engine Oil is not available, Case AKCELA No. 1 Single Grade Engine Oil can be used.

If Case AKCELA No.1 Multi-Viscosity or Single Grade Engine Oil is not available, use only oil meeting API engine oil service category CH-4.

See the chart for recommended viscosity at ambient air temperature ranges.

NOTE: Do not put Performance Additives or other oil additive products in the engine crankcase. The oil intervals given in the operators manual and service chart are according to tests with Case AKCELA lubricants.

BC02N250

DIESEL FUEL

Use No. 2 diesel fuel in the engine of this machine. The use of other fuels can cause the loss of engine power and high fuel consumption.

In very cold temperatures, a mixture of No. 1 and No. 2 diesel fuels is temporarily permitted. See the following Note.

NOTE: *See your fuel dealer for winter fuel requirements in your area. If the temperature of the fuel is below the cloud point (wax appearance point), wax crystals in the fuel will cause the engine to lose power or not start.*

The diesel fuel used in this machine must meet the specifications in the chart below or Specification D975-81 of the American Society for Testing and Materials.

Specifications for Acceptable No. 2 Diesel Fuel

API gravity, minimum	34
Flash Point, Minimum	60° C (140° F)
Cloud point (wax appearance point), maximum	-20° C (-5° F) See Note above
Pour point, maximum	-26° C (-15° F) See Note above
Viscosity, at 100° F (88° C)	
Centistokes	2.0 to 4.3
Saybolt Seconds Universal	32 to 40

Fuel Storage

If you keep fuel in storage for a period of time, you can get foreign material or water in the fuel storage tank. Many engine problems are caused by water in the fuel.

Keep the fuel storage tank outside and keep the fuel as cool as possible. Remove water from the storage container at regular periods of time.

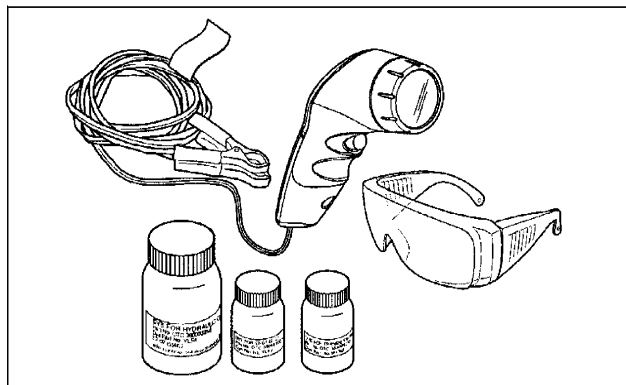

DYE AND BLACK LIGHT PROCEDURE FOR DETECTING OIL LEAKS

Oils and grease have natural phosphors and will illuminate differently under the black light. Oil, bluish-white, grease, brilliant-white, anti-freeze, greenish-yellow, sealing compounds, red to orange.

Kit part number 380040182 consisting of:

Part Number	Description	U/M	Comments	Usage
380002254	Black Light		12 Volt Ultra Violet Light	
380002357	Dye-uniglow F2HF	10 ML	Glow Green in Black Light	Engine Oil/Crankcase
380002358	Dye-uniglow F4HF	65 ML	Glow Yellow in Black Light	Hydraulic Oil
380002359	Dye-uniglow 1750	10 ML	Glow Purple in Black Light	Trnasmision Oil

NOTE: Each dye is formulated to work in conjunction with a specific fluid, therefore the dyes are not interchangeable and should only be used as described.

1. Prior to adding dye, connect the black light to the machines battery and investigate suspected areas.

2. Once suspected leak areas are found, attempt to trace the leak completely to the origin.

NOTE: At the origin, the leak should be the brightest in color.

3. After confirmation of the suspected leak, thoroughly clean the area of the leak to remove any existing fluids. Recheck the area with the black light to assure the area is clean.

NOTE: Good cleaning is important for the following reasons.

A. Fluids captured by threaded joints or other cavities will continue to show signs of leakage unless completely clean.

B. Casting surfaces can hold residual oil.

4. Use the entire contents of the bottle of dye in the system/systems of the suspected leak.

5. Run the unit for 5 to 10 minutes and cycle through suspect system functions to ensure that the dye is available to all possible leak points.

NOTE: The hydraulic oil should be heated to 160° F (71° C), engine at normal operating temperature, and transmission should be in the normal operating range on the gauge.

6. Use a clean cloth and wipe the dipstick or the inside surface of the filler tube on each of the 3 sumps.

7. View traces of dyed fluid on the cloth under the black light to ensure good samples.

8. Use these 3 samples as your baseline when inspecting the unit with the black light.

NOTE: High hour engine oil can reduce the effectiveness of the dye. In this event change the oil.

9. Avoid common errors.

A. Fan airflow blowing leaking fluid.

B. Gravity pulling leak paths down.

C. When paint at a joint is not broken, the joint is not leaking.

NOTE: It is not necessary to change oils after this check.
